production companies, refiners, and manufacturers; sharing of capital investment; and sharing such as sharing production, marketing, and engineering information among exploration and

layoffs and subsequent re-hiring. Perhaps most importantly, more stable R&D investments operating profits and lower operating costs as companies would go through fewer waves of in

involving a flat oil price compared to a volatile oil price.

Over the long term, this volatility costs the equivalent of 10% of the cost of producing a barrel of oil, according to Boston Strategies International’s 43-year simulation of two scenarios of oil, back when recession hits.

Oil companies paid higher prices that were set when markets are overheated and not rolled back after the boom. Equipment manufacturers held excess inventory during the boom and took a long time to

This bullwhip effect has caused four types of economic inefficiency at oil companies and their equipment suppliers:

• Demand induced the “bullwhip effect” in which small changes in demand cause oscillating and

Regardless of the reason behind the initial shocks, the variation from a steady state historical

From 1949 until 1973, the average annual price of oil fluctuated within a 7% band, but from 1981 through 2009 the variation leapt to almost 10 times that amount. A range of factors has

Sharp increase in demand from developing economies.
